Tutorial to Set Up Django:

First, make sure to download the latest version of python

In terminal, install:
• pip install pipenv

In the directory, install:
• pipenv install django
• pip install djangorestframework
• pip install mysqlclient

To activate the virtual environment, run: (this may change based on what OS you have, I have a macbook and this works for me)
• source .venv/bin/activate

You might have to install other libraries based on the errors that you get!

To migrate changes, run:
• python manage.py makemigrations
• python manage.py migrate

To run the django app, run:
• python manage.py runserver
• For the general website, put this link in your browser: http://127.0.0.1:8000/
• To access specific regions, put this link in your browser: http://127.0.0.1:8000/arg/region/
